Is the World a Better Place Than When I Was Born in 2003?

I was born in Denmark in 2003, one of the wealthiest and healthiest countries in the gapminder dataset. Looking at the animated scatter plot, Denmark sits firmly in the top-right corner — high GDP per capita and high life expectancy — even back in 1952. So for someone born where I was, the world was already remarkably good at the starting line. The gapminder data runs from 1952 to 2007, meaning I can compare the world at my birth in 2003 to decades prior, but not after. Within that window, the

global trend is clear and encouraging. Life expectancy rose across every continent, and GDP per capita grew in most regions. Countries once clustered in the bottom-left of the chart moved steadily upward and rightward over those 55 years. By 2003, the world had already made enormous strides. Asia in particular showed dramatic improvement — countries like South Korea transformed from low-income to high-income within a single lifetime. Even in Africa, where progress was slowest, life expectancy had risen considerably since 1952. So based strictly on what the gapminder data shows, the world I was born into in 2003 was measurably healthier and more prosperous than the world of my grandparents' generation — and Denmark was already among the best places to be born anywhere on the chart.
